RE: Site Inspection, Caliham-Sage Mine, M/037/023

On July 30, 1987, Frank Filas and Ron Daniels inspected the Caliham Mine. The site consists of a quarter-mile access road, a two-acre ore pad, five metal buildings, two small evaporation ponds (not in use), a secured decline, and five acres of waste dump (averaging 20 feet high). No environmental or safety problems were observed other than the fact that no topsoil appears to have been stockpiled.

The Sage Mine, which is located one mile further to the east, was not inspected. Atlas has a locked gate at the entrance to the Caliham which effectively bars vehicle access to the Sage also. These two mines were last worked in January of 1982.
